Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    IDENTITY_NUC

These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 214 BP; 45

The present sequence for Mycobacterium chelonae rpoB gene C fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to CC digenors with the unidentified fragment from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for Selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR CC experiment, including those difficult to distinguish by usual blochemical CC detecting specific Mycobacterial species. (AASO5227-AASO5242) for XX

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence for Mycobacterium fortuitum rpoB gene
C fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC novel pCR restriction fragment length polymorphism analysis (pRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC be identified and comparing the RFLP patterns from the known rpoB gene
CC fragments with the unidentified fragment. The rpoB gene fragments
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies including M. tuberculosis, M. leprae
CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC required), and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual blochemical
CC detecting specific Mycobacterial species.

These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC movel PCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC polymorphism digesting the DNA fragment from the microorganism to comprise the patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments or to obtain epidemological and pathogenesis information for Selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC required), and can differentiate between many species in a single CC experiment, including those difficult to distringuish by usual biochemical CC detecting specific Mycobacterial species.

The present sequence for Mycobacterium gordonae type I rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a convel pcR-restriction fragment length polymorphism analysis (PRA) cc method. The method comprises obtaining a restriction fragment length polymorphism (RELP) pattern of the 24 rpoB gene fragments; isolating, cc amplifying and digesting the DNA fragment from the microorganism to cc indentified and comparing the RELP patterns from the known rpoB gene care useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae cc and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 pcr crequired), and can differentiate between many species in a single capteria. Also described are oligonuclectide probes (AASO5227-AASO5242) for XX

                                                                                               ş
                                                                                                                                                                                             The present sequence for Mycobacterium kansasii rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from CC various Mycobacterial Species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC movel PCR restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to CC diagnosis and comparing the RFLP patterns from the known rpoB gene CC fragments with the unidentified fragment. The rpoB gene fragments CC diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC required), and can differentiate between many species in a single CC experiment, including those difficult to distinguish by usual biochemical CC deterting specific Mycobacterial species.

The present sequence for Mycobacterium ulcerans rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a convel pCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, complifying and digesting the DNA fragment from the microorganism to CC de identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments care useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR crequired), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical cests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁

                                                        The present sequence for Mycobacterium flavescens rpoB gene (C fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from (C various Mycobacterial species. These rpoB gene fragments can be used (C in the diagnosis and identification of Mycobacterium species using a (C novel PCR-restriction fragment length polymorphism analysis (pRA) (C method. The method comprises obtaining a restriction fragment length polymorphism (RRILP) pattern of the 24 rpoB gene fragments; isolating, (C amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments (C are useful to identify a wide range of Mycobacterium species, e.g. for (C selection of appropriate therapies, including M. tuberculosis, M. leprae (C and non-tuberculous mycobacteria (NTM) encountered in subjects infected (ragments is rapid, precise, simple and cost effective (only 1 PCR (C required), and can differentiate between many species in a single (experiment, including those difficult to distinguish by usual blochemical (tests, Also described are oilgonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş

The present sequence for Mycobacterium marinum rpoB gene
C fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC movel PCR-restriction fragment length polymorphism analysis (pRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (REPLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC diagnosis and comparing the RFLP patterns from the known rpoB gene
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC fragments is rapid, precise, simple and cost effective (only 1 pCR

The present sequence for Mycobacterium celatum rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments
                                                                                                                                                                                                                                                                                                            Claim 1; Page 45;
                                                                                                                                                                                                                                                                                                                                             New DNA fragments from the rpoB gene of mycobacteria, useful for diagnosis and identification of many mycobacterial species by restriction fragment length polymorphism .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           27-OCT-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAS05202 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 208 BP; 48 A; 71 C; 64 G; 25 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC novel PCR-restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC be identified and comparing the RFLP patterns from the known rpoB gene
CC fragments with the unidentified fragment. The rpoB gene fragments
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC election of appropriate therapies, including M. tuberculosis, M. leprae
CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC fragments is rapid, precise, simple and cost effective (only 1 pCR
CC experiment, including those difficult to distinguish by usual biochemical
CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
CC defection anaecific Mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

These rpoB gene fragments can be used CC in the diagnosts and identification of Mycobacterium species using a CC novel PCR restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the microorganism to gene useful to identify a wide range of Mycobacterium species, e.g. for CC arguments with the unidentified fragment. The rpoB gene fragments of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV), Analysis of the rpoB gene CC required), and can differentiate between many species in a single CC experiment, including those difficult to distinguish by usual biochemical CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for XX

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence for Mycobacterium xenopi rpoB gene
CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC movel PCR-restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RRILP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC defense that the unidentified fragment from the known rpoB gene
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC gelection of appropriate therapies, including M. tuberculosis, M. leprae
CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected
CC fragments is rapid, precise, simple and cost effective (only 1 PCR
CC required), and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual biochemical
CC detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                             C polymorphism (RFLP) pattern of the 24 rpoB gene fragment; isolating, and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments with the unidentified fragment. The rpoB gene fragments or to obtain epidemiological and pathogenesis information for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for xxx

been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is nicrease in the observed/expected third position G + C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Direct Submission
Submitted (11-JUN-1998) Submitted on behalf of the Mycobacterium tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CBIO 1SA Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mail: parkhill@sanger.ac.uk On Jun 27, 1998 this sequence version replaced gi:2143285.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Details of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.
